

ABSTRACT

BIOCHEMICAL SYNTHESIS APPARATUS

5 A biochemical synthesis apparatus comprises a receptacle
for containing a medium, and a support on which a
microorganism can be placed. The support can be placed
in contact with the medium, so as to allow access of the
microorganism to the medium. The support with the
10 microorganism can be removed from the medium, allowing
the medium to be replaced. By this, the receptacle can
firstly contain a growth medium, and secondly a secondary
medium capable of causing the production by the
microorganism of a potentially useful biochemical.
